

## Practical tips when using Daconil Ultrex

1. Read the label to determine the correct amount of product you will need to perform the desired application in order to control the disease. At the most common use rate of 115g/100 square meters, one case will treat two acres.
2. Don the appropriate proper protective equipment during the mixing and loading procedure.
3. Fill your sprayer  $\frac{1}{2}$  to  $\frac{3}{4}$  with clean water and turn on agitation.
4. Remove large screen basket from the opening in the top of the spray tank. It is not necessary to screen this water dispersible granular formulation prior to it entering the spray tank.
5. Once again, ensure that the agitation is engaged to disperse the product evenly throughout the water. The dispersing agents that are an integral part of the Daconil Ultrex formulation will ensure a uniform spray solution.
6. Open the bag of Daconil Ultrex and gently pour the product into the opening on top of the spray tank. Pour the product close to the opening in the top of the spray tank to minimize dust while pouring.
7. Once the bag is empty, gently tap the outside bottom of the bag to ensure that no particles are left in the bag. The static free foil lining will prevent particles from adhering to the inside of the bag so there will be no residue left in the empty bag.
8. Tear the bag to eliminate any other possible use and dispose of it in the dump bin along with the shipper carton.
9. In the event of inclement weather or a mechanical breakdown, make sure you keep the agitation system engaged in order to prevent settling.

If you have any questions about how to use Daconil Ultrex and how you can make it an easy fit into your disease management program, please do not hesitate to give me a call or call your Engage Agro Technical Representative at 519-826-7878 extension 236.

We hope that you will enjoy the convenience of the Daconil Ultrex formulation!
