NEWS UPDATE: MANIPULATOR PGR

We are happy to announce that **Manipulator PGR is now available** for use on **oats and barley**, in addition to wheat, for the 2020 growing season.

Manipulator PGR supports the push for higher yields by helping plants develop shorter, stronger stalks. This results in better straw management, the prevention of lodging and overall improved harvest efficiencies.

2020 Keep It Clean Program Status: Manipulator on wheat and oats has a “no recommendations / green” classification. Manipulator on barley for feed and silage also carries a “no recommendations / green” classification. Malt barley specifically will have a “be informed / amber” classification for the 2020 growing season.

Belchim Malt Barley Recommendation: Producers growing malt barley under contract are encouraged to consult with their grain buyer prior to using Manipulator on barley. Some barley contracts may restrict against the use of Manipulator. Similarly, producers growing barley without a malt contract, but intending to sell their barley as malt quality, should also consult with their grain buyer. Failure to consult with your grain buyer prior to use of Manipulator on malt barley could result in rejection. There are no restrictions on the use of Manipulator on feed barley.
